Aurora Quay Polar Research Station

Operations and Safety Brief

Revision: 3.2

Station director: Dr. Mira Solberg

Review date: 18 March 2044

Purpose

This brief defines logistics, power allocation, and emergency procedures for Aurora Quay. The station's radio identifier is AQ-POLAR-73.

Arrival protocol

The icebreaker Meridian arrives at Dock North on 22 March 2044 at 07:15. Its manifest includes 24 thermal battery modules and 36 sealed food crates.

Before unloading, the dock officer must verify seal code LYNX-44 and contact logistics lead Ivo Chen on channel Frost-8.

Power Allocation

Aurora Quay has 900 kWh of discretionary energy available each day. Allocation percentages and shutdown priorities are shown below.

System	Allocation	Daily energy	Shutdown priority
Laboratory	40%	360 kWh	Third
Habitation	35%	315 kWh	Never during occupancy
Greenhouse	25%	225 kWh	Second

Conservation rules

• If total battery reserve falls below 180 kWh, suspend laboratory experiments before reducing greenhouse power.

• If reserve falls below 120 kWh while the station is occupied, keep habitation online and shut down the greenhouse after the laboratory.

• The backup generator, Borealis, may be started only by the station director or deputy director Arun Vale.

Emergency Response

Whiteout alert

When visibility drops below 30 metres, announce code GLASS OWL, close Dock North, and move all field teams to Shelter Kappa. Use radio channel Sleet-3 for the alert.

If a whiteout begins while the Meridian is unloading, stop unloading first, verify that all 24 thermal battery modules remain sealed, then close Dock North.

Medical escalation

For suspected cold injury, contact medic Leena Park. If Leena is unavailable, deputy medic Tomas Rhee assumes responsibility. Use medical kit Cobalt-6 from Locker 14.

Communications failure

If the primary antenna fails during a whiteout, activate beacon NARWHAL-2 and repeat code GLASS OWL every 12 minutes until channel Sleet-3 is restored.
